

Q: What is it that is different about the diagram?

A: The number of products needed to solve a multitude of "BUILDING PROBLEMS"

Other suppliers recommend products for either internal or external use, below or above ground, for negative or positive pressure only, or needing primer, finish coating or protection because of "technical performance limitations" to their products. DRIZORO has developed their Products Range to cut across most other products and perform as a technically-superior multifunction single-product solution to most building problems.

MAXSEALFLEX: A technically-superior multifunction product that can be applied to most surfaces, internal and external use, below and above ground for negative and positive pressure and, not needing primer, finish coating or protection.

CONCRETE SLABS, BELOW AND ABOVE GROUND: Roof, gutters, balconies, under tiles or exposed, can be applied to "green" concrete, will slow down curing, reducing shrinkage cracking, excellent crack bridging up to 3mm and capable of thermal movement up to 4mm. On internal concrete under tile, carpet, timber/parquetry, to reduce moisture damage. Sealing water ingress to up to 40 metres of negative, 90 metres positive head pressure.

WATER CONTAINMENT: Swimming Pools (salt and chlorine), ballast tanks, water tanks, reservoirs, water features, water and sewer treatment, water and sewer infrastructure. AS/NZ4020 approved.

INFRASTRUCTURE CONSTRUCTION: e.g. culverts, bridges, abutments, protection against aggressive water/soil – acid and/or alkali. Total resistance to Carbon attack.

PERMANENT FORMWORK: Dintel, Redi wall (CSR approved), AFS, SIP Panels, also Lightweight aerated, Polystyrene construction materials - Hebel, Ytong, Poly walling- as well as any other Brick or Block: Will adhere to metal surfaces - can be used as waterproofing application but also as a "bonding bridge" to apply any other surface treatment normally applied to mortar surfaces. i.e. render, texture, paint.

GENERAL APPLICATIONS: Total negative/positive water proofing of: Below and above ground retaining walls, garden bed, planter box construction.

MAXSEAL FOUNDATION: Can be used as a more cost effective alternative in general applications.

Looking at pricing, most products do NOT appear to have much of a "Sticker Shock." However, when looking at the technical performance and application rates there appears to be a serious "Sticker Sting" in the tail. In comparison to square metre application rates and cost of material per square metre. It is said that Drizoro Products are an "easy sell" as they are multifunctional and cost effective, there is "NO" confusion as to what to use and where. Most in the construction industry would welcome the availability of a single, time proven, "Technically "superior, cost effective solution to their "multiple" water proofing problems.

THE BOTTOM LINE – SAVING TIME AND MONEY.
